

## dis easy-clean

Surface treatment of the industrial floor  
using the finest diamond grinding technology.

### System description

- Surface treatment by full grinding. The industrial floor is dry-ground using effective, patented machines and unique diamond and polishing tools.

The result is a look with a partially visible grain structure, the so-called 'salt and pepper look'.

The ideal basis for **dis easy-clean** is our **displan** industrial flooring.

**dis easy-clean** is also excellent for renovating and revitalising of existing floors.

### Area of application

- Production plants
- Assembly halls
- Logistics and storage halls
- workshops
- Driveways
- High-bay warehouse

### Process steps

- The first step is the surface treatment of the finished industrial floor, i.e. fine sanding with special plastic diamond pads.
- The surface treatment is carried out in 1 to 2 sanding steps in order to achieve a high-quality appearance.
- After thorough cleaning, the surface is first treated with Discare HPS and then polished after curing

### Advantages

- Processing the industrial floor gives the surface a high degree of evenness. The floor becomes more wear-resistant, easy to maintain and inexpensive to clean.
- The running smoothness for industrial transport vehicles is increased - maintenance costs are reduced.
