

## disterrazzo

Finished with diamond grinding.  
The hard-wearing, polished and shiny floor.

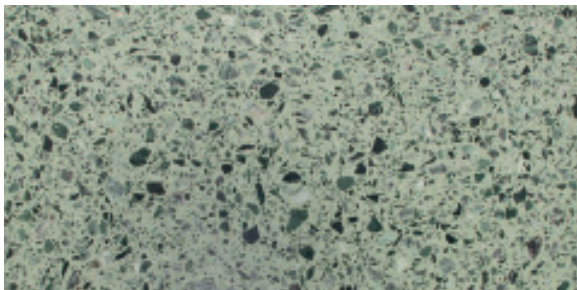

### System description

- Surface treatment by full grinding. The industrial floor is dry-ground using effective, patented machines and unique diamond and polishing tools.

The result is a highly economical surface with a visible grain structure that impresses with its attractive appearance and high mechanical load-bearing capacity.

The ideal basis for **disterrazzo** is our **displan** industrial flooring.

**disterrazzo** is also excellent for renovating and revitalising of existing floors.

### Area of application

- production facilities & assembly areas,
- warehouses,
- workshops,
- transshipment halls & high-bay warehouses,
- Presentation areas
- Areas with public traffic

### Process steps

- The first step is the surface treatment of the finished industrial floor, i.e. fine sanding with special plastic diamond pads.
- The surface treatment is carried out in 6 to 7 sanding steps in order to achieve a high-quality appearance and a high level of evenness.
- After thorough cleaning, the surface is first treated with Discare HPS and then polished after curing

### Advantages

- Processing the industrial floor gives the surface a high degree of evenness. The floor becomes more wear-resistant, easy to maintain and inexpensive to clean.
- The running smoothness for industrial transport vehicles is increased - maintenance costs are reduced.
